

QuantCore

Make Every Investment Decision With Institutional-Grade Intelligence

One platform that answers the four questions that matter: *What should I trade? When do I get in? When do I get out? How much do I risk?*

Every signal that moves a stock — in one place	An AI analyst that works the full process on demand
Disciplined, rule-driven exits — no emotion	Proven live: +112% on the most recent closed trade

June 2026

Page 2 — The Problem

Most investors lose to process, not to markets

- Market information is **scattered** — price action, options activity, company quality, and news each live in different apps with different stories
- The synthesis that institutions pay six figures for — *who is really buying, where the mechanical price magnets sit* — is invisible to individuals
- Entries are researched for hours; **exits are improvised in seconds**
- Emotion fills every gap that process leaves open

The cost isn't bad picks — it's giving back gains through undisciplined exits, oversized positions, and chased entries.

Page 3 — What QuantCore Does

Five capabilities, one workflow

DISCOVER ■	DECIDE ■	ENTER ■	MANAGE ■	EXIT ■
Screen the whole market by quality, momentum, smart money	One verdict per stock: buy / skip / watch — with reasons	Timing signals + position size from a fixed risk budget (never bet the farm)	Daily checkups on every holding, with alerts when anything changes	Pre-planned profit ladders + bail triggers that fire automatically

- **Discover** — rank any list of companies by financial quality, growth trajectory, and momentum
- **Decide** — a single recommendation that weighs *everything*, with the reasoning shown
- **Enter** — entry, target, and stop priced before a dollar moves; size set by risk, not conviction
- **Manage** — every position re-checked daily; alerts arrive instead of being sought
- **Exit** — profit-taking ladders and bail triggers defined at entry, executed without hesitation

Page 4 — The Decision Engine

Every stock gets one honest verdict

The engine weighs **19 independent signals** — trend, real buying pressure, company quality, institutional options activity, momentum, fear gauges, news tone — and produces:

Output	What it means for the investor
Verdict	Buy stock, buy options, skip, or watch — with the trade structure chosen for current conditions
Confidence	How strongly the evidence agrees — sizing follows confidence, not excitement
Entry / target / stop	The full trade, priced before commitment
Position size	Calculated from a fixed 2% risk budget per trade
The reasoning	Every driver and warning listed — auditable, not a black box

"Skip" and "watch" are first-class answers. The engine prevents more losses by refusing ambiguous setups than it earns by finding good ones.

Page 5 — An Edge Most Individuals Never See

Reading the market's plumbing

- **Where market makers must buy or sell** — hedging mechanics create predictable support and resistance; QuantCore maps these levels daily
- **What institutions are actually doing** — aggressive options buying is detected and scored for conviction, separating real positioning from noise
- **Whether real money agrees with the price** — volume-flow analysis reveals quiet accumulation and distribution before the chart shows it
- **When fear is tradeable** — capitulation and stress gauges flag bounce candidates, with confirmation rules to avoid catching falling knives

This is the layer that turned WMT into +112%

The engine spotted that a rally would stall at a mechanical resistance level — and said so **the day before it happened**. Profits were taken into strength; the fade came on schedule.

Page 6 — Disciplined Exits, Automated

The exit is designed at entry — then it runs itself

Profit-taking ladders. Each holding gets a ladder of sell targets calibrated to *that stock's own volatility* — not arbitrary round numbers. As price climbs each rung, an alert fires with the exact shares to sell.

Bail triggers. Every position carries a pre-stated invalidation level requiring multi-signal confirmation — one bad tick doesn't shake the position; a broken thesis does.

Always-on monitoring. Every day, automatically:

- Full portfolio health report with charts and returns
- Alerts when any holding violates its trend, falls below cost, or hits a ladder rung
- Notifications delivered to Discord — the system finds *you*

Result in practice: the discipline to sell 60% of a winning options position into strength — then exit the rest when the bail trigger fired — turned a trade that buy-and-hold would have closed at +34% into **+112%**.

Page 7 — An AI Analyst On Staff

The entire platform is operable by AI

QuantCore is built so an AI assistant can run the *whole* investment process conversationally:

- "Run a full analysis on NVDA" → complete multi-signal workup with verdict, levels, and caveats — in about a minute
- "Find me construction companies worth buying" → screened, ranked, and added to the watchlist
- "How is my WMT spread doing?" → live position mark, updated odds, and a concrete recommendation
- Every analysis is archived as a dated report (markdown + PDF) — building an institutional memory

And the system learns. Each closed trade is reviewed: which signals predicted, which misled. The playbook is updated. The next decision starts smarter than the last.

Page 8 — Proven In Live Use

Real money, real exits, real calibration

Trade	What the platform contributed	Outcome
WMT options spread	Called the rally cap; timed partial exit + final bail	+112% in 5 days
IMSR bounce entry	Confirmed real buying before entry	+21% in 4 sessions
MRVL at \$301	"Watch, don't trade" — refused the chase	Avoided the -8% fade
TSLA at \$348	"Do not buy" — distribution detected	Saved a bad entry

What's next

1. **Richer dashboards** — surfacing the decision engine and company-quality scores visually
2. **Deeper history** — trend-tracking on institutional positioning signals
3. **More automation** — scheduled AI deep-dives on the whole portfolio, delivered before market open

QuantCore: one investor's edge, compounding.
